

## Section A

1) what is data?

- Data is a collection of raw facts values or information that can be stored & processed.

2) what is database?

- A database is an organized collection of data that can be stored, accessed managed & updated efficiently.

3) What does DBMS Stand For?

- Database Management System

4) What does RDBMS Stand For?

- Relational Database Management System

5) What is MySQL?

- MySQL is an open source relational database management system that uses SQL to create manipulate & manage.

6) What is SQL?

- SQL is Structured Query language  
SQL is a language used to communicate with relational Database

7) Name Any two Database Model?

- Network database  
Relational database  
NoSQL Database.

8 What is row in a database models?

— Row is A single entry in table

9) What is purpose of the DISTINCT keyword?

— It will return unique value

10) What does the % wildcard represent in MySQL LIKE?

→ %- Percentage Symbol represent zero ONE or multiple character

### Section B

11) Differentiate between Database & DBMS

Database

DBMS

— fast searching

1) general database management System

— can be stored, accessed managed & update efficiently

2) can Support different database model depending System

3) organized collection of data

Database mangement System

## Q2) SQL MySQL

- |                                      |                                    |
|--------------------------------------|------------------------------------|
| 1) SQL is used to write query        | used to manage relational database |
| 2) contain SQL command               | Execute SQL command                |
| 3) SQL is structural query language. | MySQL not programming language     |

## Q3) SQL command

- 1) DDL - Data Definition language
  - Create
  - Drop
  - Alter
  - Truncate
- 2) DML - Data manipulation language
  - Insert
  - Update
  - Delete
- 3) DQL - Data Query language
  - Select
- 4) DCL - Data control language
  - Grant
  - Revoke

14) IN Between

1) Select Data win  
IN

1) To give a range in  
mysql we use  
Between operator

2) To Specify multiple  
possible value for a  
column.

2) Between a certain  
Range.

Q 15) Explain IS Null & Not Null with suitable SQL example

- IS Null

- select data is null;  
where age is null;

eg - ~~mysql~~ select \* from employee  
where age is null;

2) Not Null

- select \* from employee  
where address is not null;

Section G

Section C

Q16 → DBMS

- Stand Database  
management system

- can support different  
database model depending

RDBMS

stand Relational data  
base management system

Data represent  
using table.

## § 17) Hierarchical Database

- A hierarchical database organized data in tree like structure

## 2) Network Database

- Network Database organizes data as inter connected records & supports multiple relationship among record.

## 3) Relational database

- organizes data into table consisting rows & columns.

| employee-id | Name  | Age | Address |
|-------------|-------|-----|---------|
| 101         | Rahul | 22  | Pune    |
| 102         | Ram   | 25  | Nagar.  |

## 4) Object - oriented Database

- An object - oriented database stored data in the form of objects

eg:-

student object

+ --- name = Siddhi

--- age = 22

--- course = BCA

### 5) No SQL Database

NoSQL is broad category of database that uses data models other than, or beyond the traditional-table model.

19)

a) Select \* From STUDENT  
where age = 20;

b) Select \* From STUDENT  
where age BETWEEN 20 and 23;

c) select \* From STUDENT  
where city IN ("Mumbai", "Delhi");

d) Select \* From STUDENT  
where gender = "female";

e) select \* From STUDENT  
where name LIKE "P%";

Q 20 z a) Select \* STUENT  
where name LIKE "A%";

b) Select \* STUENT  
where name LIKE "%a";

c) select \* STUENT  
where name LIKE "--0%";

~~Select \* STUENT~~  
~~where~~

d) Select \* STUENT  
where name LIKE "-a%";
