Section A — 1 marks

1) what is data ?

→ Data is a collection of raw information.
eg:- punam
21
python

facts.

information.

2) what is database ?

→ database is a organized collection of information.

3) what does DBMS stand for ?

→ DBMS stands for DataBase management system.

4) what does RDBMS stand for ?

→ RDBMS stands for Relational DataBase management system.

5) what is MySQL ?

→ MySQL is used open-source.

6) what is SQL ?

→ SQL stands for structural query Language.

- SQL is language.

- So communicate with relational database.

7) name any two database models.

→ 1) Network Database

8) what is a row in a database table?
→ record in a table. | single entry in a table.

9) what is the purpose of the Distinct keyword?
→ Distinct keyword represent only unique Column name. (1)

10) what does the % wildcard in MySQL?
→ % wildcard is represent one or more characters. (1)

* Section B - 2 marks

11) Differentiate Between Database and DBMS
→ Database DBMS

(1) Database is organized collection of information that can be stored & update efficiently.

(1) DBMS is a software that used to store and retrieved the data in database.

(2) DBMS stands for database management system.

12) Differentiate betⁿ SQL & MySQL
SQL MySQL

(1) SQL stands for structural query language

MySQL

(1) MySQL is used SQL & RDBMS. (2)

(2) SQL is language

(3) SQL is communicate with Relational Database

(2) MySQL is open Source.

13) write any four SQL Command ^{Categories} & give one Command for each.

→ 1) DDL - DDL stands for Data Definition Language.
Command :- Create, drop etc.

2) DML - DML stands for Data manipulation language.
- Insert, update.

3) DQL - Data Query language
- Select

4) TCL - TCL stands for Transaction Control Language.
Command - Commit, rollback

14) difference between In and Between ?

In	Between
① It is represent multiple values using In operator	① It is represent range between values.
② eg:- select * from Student where age IN(21,19,40);	② eg:- select * from Student where age Between 20 and 25;

15) IS Null & IS Not Null ?

→ IS Null :- ~~cell~~ value in a row is empty.

Null :- is not null.
- not empty

* Section C - 5 marks

Q. 16 Explain DBMS & RDBMS. Write at least three difference between them.

→ ① DBMS - DBMS stands for Database management system.

② RDBMS - RDBMS stands for Relational Database Management System.

DBMS

RDBMS

① DBMS stand for Database management system

① RDBMS stands for Relational database management system.

② DBMS is a software.

② RDBMS is a type of DBMS.

③ It is used to store, update, retrieved the data in database.

③ RDBMS represent relationship.

④ It is used primary key Foreign key.

5

Q. 17) Explain the following database models with their basic structure.

→ 1) Hierarchical Database

- Hierarchical Database is represent Tree structure.

2) Network Database :-

- It is represent interconnected records.

3) Relation Database.

- It is stored data in table.

- rows & columns.

4) object - oriented Database.

- object-oriented database represent data in form of object.

5) NoSQL :-

5

- Graph

18) Explain the six MySQL constraints given in the notes. Write the purpose of each.

- 1) Not Null :- find records of column - do not empty.
- 2) UNIQUE :- value has unique.
- 3) Default :- value is default.
- 4) Check :- check condition.
- 5) Foreign Key :- primary key in one table is foreign key in another key. (5)
- 6) Primary Key :- primary key is unique.

19)

→ a) Display students whose age is 20.
Select ^{name} age from students
where age = 20;

o/p :-

age	name	age
	Rahul	20
	Anjali	20

b) Display students whose age is between 20 and 23.

→ Select name, age from students
where age Between 20 and 23;

o/p.

name	age
Rahul	20
Priya	21
Amit	22
Rohit	23
Anjali	20
Pooja	21

c) Display students from Delhi or Mumbai using IN.

→ select * from city
where city IN (Delhi, Mumbai);

o/p:-

id	name	age	gender	city
1	Rahul	20	male	Delhi
2	Priya	21	female	Mumbai
8	manish	25	male	Delhi

d) Display only female students.

→ select * from students
where gender = "female";

o/p:-

id	name	age	gender	city
2	Priya	21	female	Mumbai
4	Neha	19	female	Gaya
6	Anjali	20	female	Jaipur
7	Pooja	21	female	Kolkata

e) Display students whose name starts with p.

select name from students
where name Regexp "p";

20) a) name starting with A

→ select name from student
where name LIKE "A%";

o/p:- Amit
Anjali

b) Names ending with a

→ select name from Students
where name LIKE "%a";

o/p:- Narge
Amit, Anjali

c) names containing am
→ select name from Students
where name LIKE "%am%";

olp :-

name
Amit

①

d) Names having a as the second character.

→ select name from Student
where name LIKE "_a%";

olp :-

name
Rahul
Manish

①

e) Names having o as the third character.

→ select name from students
where name LIKE "__o%";

olp :-

name
Pooja

①

2) Explain the following MySQL concepts with syntax & example.

→ select Distinct marks
from students;

olp :-

marks
10
10
30
50 marks

①

— Distinct represent unique column name.

d] count ()

- It is count the value in
Syntax :- count (column_name); ①

e] sum ()

- It ~~is~~ returns total sum of value
Syntax :- sum (column_name); ①

b] Limit

eg :- select * from students
where
